| | There is sufficient evidence in humans for the carcinogenicity of inhaled crystalline silica in the forms of quartz and cristobalite from occupational sources. |
| | There is inadequate evidence in humans for the carcinogenicity of amorphous silica. |
| | There is sufficient evidence in experimental animals for the carcinogenicity of quartz and cristobalite. |
| | There is limited evidence in experimental animals for the carcinogenicity of tridymite. |
| | There is inadequate evidence in experimental animals for the carcinogenicity of diatomaceous earth. |
| | There is inadequate evidence in experimental animals for the carcinogenicity of synthetic amorphous silica. |
